

## DPD TESTER Cl/pH - Test kit using tablets.

Instructions for use:

1. Rinse the chambers of the tester with the water that you will check.
2. Fill them up to the line with controlled water (from the pool).
3. Chlorine test - add DPD No.1 tablet. Do not touch the tablet with your fingers.
4. pH test - add DPD PHENOL RED tablet. Do not touch the tablet with your fingers.
5. Place the cap on the test chambers and stir repeatedly.
6. After the DPD tablets are completely dissolved, compare the color of the tested water with the CL scale and pH values.

Recommended values: Cl - 0.5 mg/l, pH - 6.9 - 7.4.

Note: Water should be collected 20-30 cm below the surface and 20-30 cm from the edge of the pool.

The chlorine test determines whether there is a sufficient amount of chlorine in the pool to destroy bacteria and algae. The pH test determines the pH of water (acidity, alkalinity)

Important: Perform the tests in the shade and early in the morning or late in the evening, before adding chemicals. Store the tester in a dark and cool place. Keep test chambers clean and dry.
